## Jenkins Installation

- Launch an EC2 instance with Amazon Linux 2 with below [userdata](#)
- As Jenkins is developed in Java, the server that will run Jenkins should have Java Installed.

```
#!/bin/bash
sudo yum update -y
sudo wget -O /etc/yum.repos.d/jenkins.repo http://pkg.jenkins-
ci.org/redhat/jenkins.repo
sudo rpm --import https://pkg.jenkins.io/redhat/jenkins.io.key
sudo yum upgrade -y
# Add required dependencies for the jenkins package
# sudo yum install java-1.8.0 -y
sudo amazon-linux-extras install epel -y
# Java 11 is required for latest Jenkins Versions
sudo amazon-linux-extras install java-openjdk11 -y
sudo yum install java-devel -y
sudo yum install fontconfig -y
sudo yum install jenkins -y
sudo yum install git tree -y
sudo systemctl start jenkins
sudo systemctl enable jenkins
```

This package installation will:

- Setup Jenkins as a daemon launched on start. See `/etc/init.d/jenkins` for more details.
- Create a `jenkins` Linux user to run this service.
- Populate `/etc/default/jenkins` with configuration parameters for the launch, e.g `JENKINS_HOME`
- Set Jenkins to listen on port `8080`. Access this port with your browser to start configuration.
- Login to EC2 Jenkins Server using `ssh`.

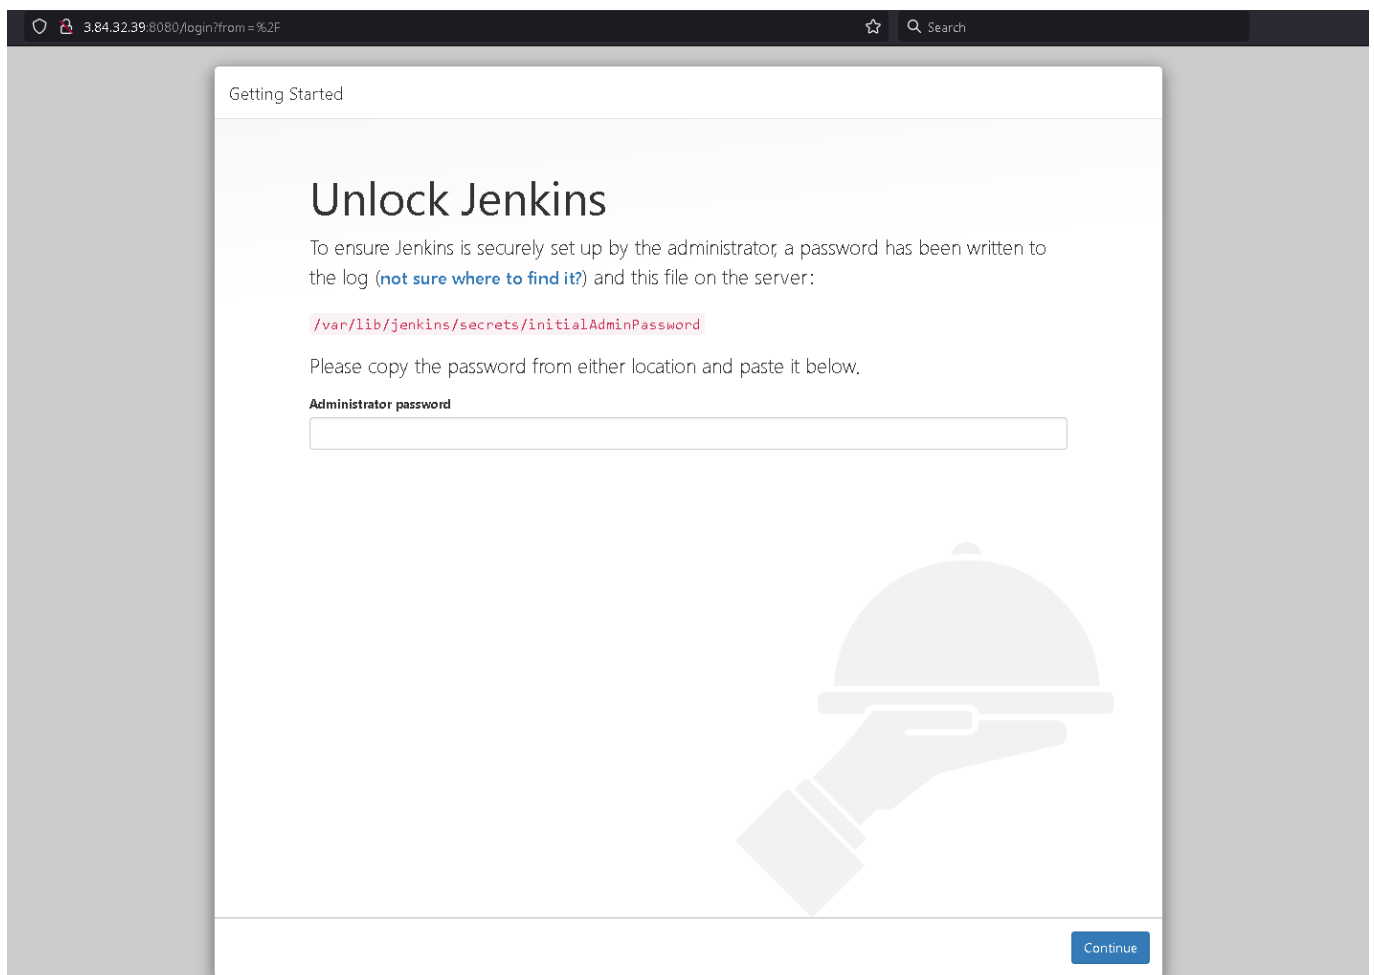

```
netstat -nltp
sudo hostnamectl set-hostname jenkins.example.com
sudo service jenkins status
sudo service jenkins stop
sudo service jenkins restart
```

- Check Jenkins Port Information

```
sudo cat /etc/sysconfig/jenkins | grep -i JENKINS_PORT
ps -elf | grep 8080
```

- Access the Jenkins UI

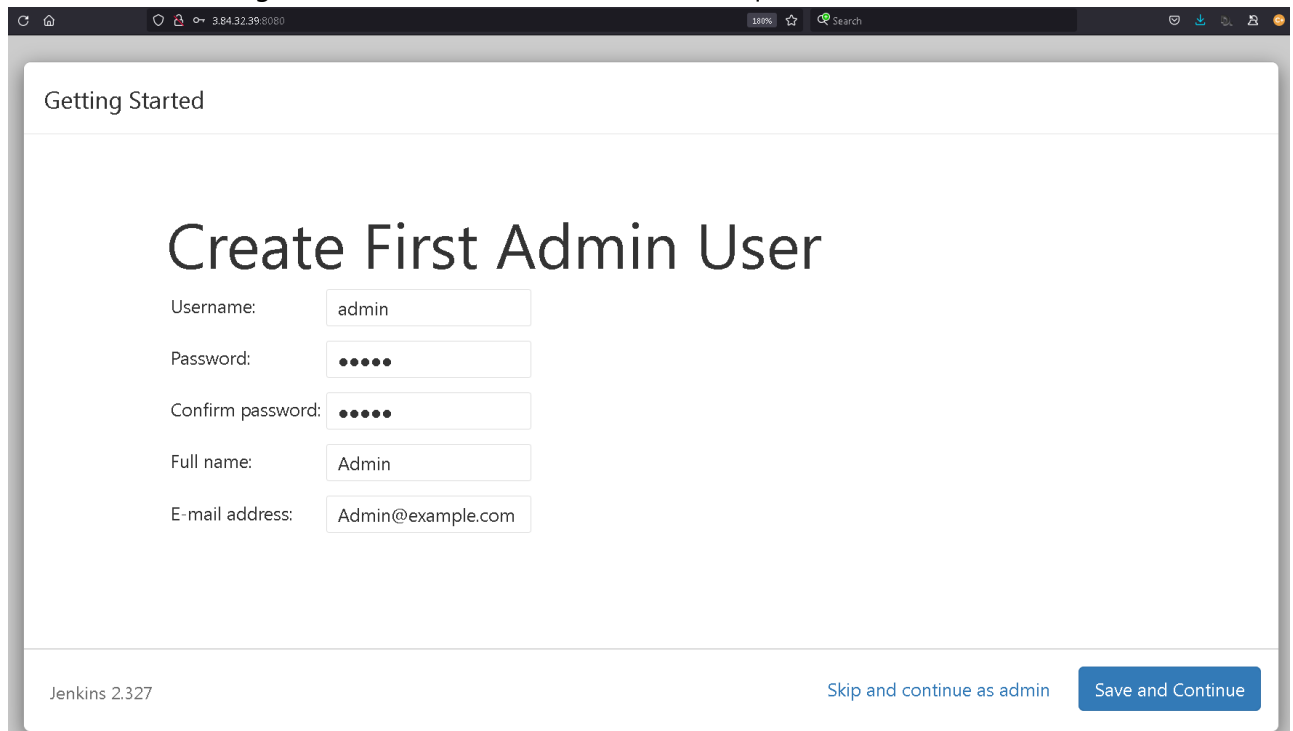

`http://public-ip:8080`

- Admin Password is written to a file, copy output of below command and enter in the browser.

```
sudo cat /var/lib/jenkins/secrets/initialAdminPassword
```

- On next page, Select **Install Suggested Plugins** only.
  - Here, Jenkins will Install Plugins that can be used later
- It will ask for creating first **Admin** user, enter details as required.

The screenshot shows the Jenkins 'Getting Started' page. The main heading is 'Create First Admin User'. Below it, there are five input fields: 'Username' (filled with 'admin'), 'Password' (filled with dots), 'Confirm password' (filled with dots), 'Full name' (filled with 'Admin'), and 'E-mail address' (filled with 'Admin@example.com'). At the bottom left, it says 'Jenkins 2.327'. At the bottom right, there are two buttons: 'Skip and continue as admin' and 'Save and Continue'.

- In Linux SSH Session of Jenkins Server, A linux user with name **jenkins** is created while Jenkins Installation, add **jenkins** user in linux to **sudoers** group.
- All Jobs in jenkins are executed by **jenkins** linux user

```
cat /etc/passwd | grep -i 'jenkins'
sudo usermod -a -G wheel jenkins
id jenkins
```

- Current home directory for jenkins is **/var/lib/jenkins**
- To view the Jenkins Systems Information, navigate to **Manage Jenkins > System Information**

## Jenkins Freestyle Project

### FreeStyle Job with No Source

- Click on **New Item** then enter an item name, select **Freestyle project**.
- Under **Source Code Management** Section, select **No Source**

- Under **Build Step** > **Add Build Step** > **Execute Shell** , Select enter below bash commands to be executed in the freestyle project.

```
echo "This is Jenkins FreeStyle Job"
printenv
id
```

- Click on **Apply** and then **Save**
- Click on **Build Now** to start execution of Job.
- For every Jenkins Job execution, Jenkins creates a Build Number **#1** for first build. Click on **#1** and **Console Output**.

The screenshot shows the Jenkins web interface. The top navigation bar includes the Jenkins logo, a search bar, and user information (admin). The left sidebar shows the job 'jenkins-freestyle-job' with build #1. The main content area is titled 'Console Output' and displays the following text:

```
Started by user: admin
Running as SYSTEM
Building in workspace /var/lib/jenkins/workspace/jenkins-freestyle-job
[jenkins-freestyle-job] $ /bin/sh -xe /tmp/jenkins6299458457800551219.sh
+ printenv

```

## Build with Parameters

- A Job in Jenkins supports Runtime Parameters that can be passed while executing the Job.
- This can to run a Pipeline Job as per SDLC Environment or any other value to be passed on Job Runtime.
- Under a specific jenkins project, select **Configure** option, select the checkbox **This project is parameterized** and **Add Parameter**.
  - Add a **Choice Parameter** with parameter name as **EnvironmentName** and enter values
    - dev
    - qa
    - prod
    - test
- For testing the value of the runtime parameter, keep **Source Code Management** as **None**
- Add in **Execute Shell** add a line **echo "This is the User Input Value for : \$EnvironmentName"**
- The parameters are available as **environment variables**. So a shell **\$PARAM\_VAR**, can be used to access these values.
- Click on **Build Now** to start execution of Job.

## FreeStyle Job with Git Url Source

- Under the Job Configuration Page, Select the GitHub project checkbox and set the Project URL to point to your GitHub Repository.
  - The repository clone URL can be `https://github.com/YourUserName/REPOSITORY_NAME.git` or `git@github.com:YourUserName/REPOSITORY_NAME.git`
    - If Repository Clone URL is `https`, Jenkins Credentials should have username and password or Token based authentication required for https authentication.
    - If Repository Clone URL is `ssh`, Jenkins Credentials should have SSH Private Key associated with Public Key that will be used to authenticate with Github.
- Under **Source Code Management** Section: Provide the Github Repository URL where Source Code is present, keep the branch as `master` or `main`.
- Go to **Jenkins Project -> Configure -> Under Build Environment Build Step > Select Execute Shell Script** from dropdown > `write shell commands`

Execute a shell script stored in Github repo by providing path.

- Click on **Build Now** to Build this Project.

## Jenkins jobs and workspace information

The Jenkins home directory structure

| Directory | Description  |
|-----------|--|
| jobs      | Path <code>/var/lib/jenkins/jobs</code> . It contains configuration details about the build jobs that Jenkins manages, as well as the artifacts and data resulting from these builds.  |
| workspace | Path <code>/var/lib/jenkins/workspace</code> . It is where Jenkins builds your project: it contains the <code>source code</code> Jenkins checks out, plus any files generated by the build itself. This workspace is reused for each successive build, there is only ever one workspace directory per project, and the disk space it requires tends to be relatively stable. |

## Jenkins Environment Variables:

- To view all the environment variables simply append `env-vars.html` to your Jenkins Server's URL. For e.g `http://<JENKINS_IP>:8080/env-vars.html`
- Create a simple free style job to display the value of the environment variables that are set for a Jenkins Job:
- Under Build Section > Add build step > Execute shell , add below commands:

```
echo "BUILD_NUMBER" :: $BUILD_NUMBER
echo "BUILD_ID" :: $BUILD_ID
echo "BUILD_DISPLAY_NAME" :: $BUILD_DISPLAY_NAME
echo "JOB_NAME" :: $JOB_NAME
echo "WORKSPACE" :: $WORKSPACE
echo "JENKINS_HOME" :: $JENKINS_HOME
echo "JENKINS_URL" :: $JENKINS_URL
```

```

echo "BUILD_URL" :: $BUILD_URL
echo "JOB_URL" :: $JOB_URL
echo "GIT_COMMIT" :: $GIT_COMMIT
echo "GIT_BRANCH" :: $GIT_BRANCH
echo "GIT_URL" :: $GIT_URL
echo "Below output is all the environment variable in Jenkins"
printenv

```

- The `printenv` command prints all the Jenkins Environment Variables set for that specific Build.

## Jenkins Github SSH Integration

### Github SSH Keys Configuration

- Generate ssh keys and add to **Github Account** **OR** **Specific Github Repo**

```
ssh-keygen -t rsa -b 4096 -C "your_email@example.com"
```

- This creates a new ssh key pair, using the provided email as a label.
- SSH Keys can be configured as per below:

| Github Account SSH Keys   | Github Repository SSH Keys   |
|---|--|
| Github UI > Settings > SSH and GPG Keys<br>> New SSH key > Add SSH Key > Add Public<br>Key Content > Confirm password | Github Repository > Settings > Deploy keys ><br>Add Deploy Key > Enter Name and Public ssh<br>key Allow Write Access > Add Key |

## Jenkins Credentials

- Jenkins configuration to access private repo using HTTPS Clone URL.
  - In Github, navigate to: **Github Account > Settings > Developer settings > Personal access tokens > Generate new token**. Add this value in Jenkins Credentials.
  - Navigate to **Jenkins dashboard -> Manage Jenkins > Manage Credentials > System > Global credentials > Add credentials**. From dropdown select **Username with password** and specify the **ID , Username** and configure the **Password**, in this field enter the Github PAT Token created in the previous step.

**New credentials**

Kind: Username with password

Scope: Global (Jenkins, nodes, items, all child items, etc)

Username: jenkins-https-pat-token

☒ Treat username as secret

Password: [masked]

ID: jenkins-https-pat-token

Description: jenkins-https-pat-token

[Create](#)

- 
- While setting up a Job in Jenkins, add the credentials created above to the credentials section in **Source Code Management** under the **Repository URL**.

**Source Code Management**

Configuration

- General
- Source Code Management**
- Build Triggers
- Build Environment
- Build Steps
- Post-build Actions

None ☐ Git ☒

**Repositories**

Repository URL: https://github.com/cloudmlops/git-practical.git

Credentials: jenkins-https-pat-token

[+ Add](#) [Advanced...](#)

[Add Repository](#)

**Branches to build**

Branch Specifier (blank for 'any'): \*/master

[Save](#) [Apply](#)

- 
- Execute the Job and test whether Jenkins Job is able to check out Github Specified Branch.
- Validate the Job Execution Details.
- Jenkins configuration to access private repo using SSH Clone URL.
  - Navigate to **Jenkins dashboard** -> **Managed Jenkins** > **Manager** > **Jenkins** > **Credentials** -> **System** -> **Global credentials** -> **Add credentials**.
  - From dropdown select **SSH Username with Private Key** and specify the **ID** , **Username** and configure the **SSH Private Key** which is stored in **.ssh** folder under the file name **id\_rsa**.
  - While setting up a Job in Jenkins, add the credentials created above to the credentials section in **Source Code Management** under the **Repository URL**.
    - Check for <https://plugins.jenkins.io/git-client/#plugin-content-ssh-host-key-verification>
  - Execute the Job and test whether Jenkins Job is able to check out Github Specified Branch

## Jenkins Build with Jenkinsfile

- Navigate to **New Item**, Provide a name for your new item and select **Pipeline** type.
- Enter below Pipeline code into the Script text area.
- **Jenkinsfile**

```

pipeline {
    agent any
    parameters {
        string(name: 'myParameter', defaultValue: 'myVal', description: 'Enter
Parameter value?')
    }
    stages {
        stage('Build') {
            steps {
                echo 'Building..'
                echo "Running ${env.BUILD_ID} on ${env.JENKINS_URL}"
            }
        }
        stage('Test') {
            steps {
                echo 'Testing..'
                echo "${params.myParameter} is value retrieved!"
            }
        }
        stage('Deploy') {
            steps {
                echo 'Deploying....'
            }
        }
    }
}

```

- Execute the Jenkins Pipeline and validate the stage and steps execution in the Build Execution Console Output.
- Add the Jenkinsfile Program Code into Github Repository, and use **Pipeline Script from SCM** and configure the Github Authentication to point the Jenkins Job to the Jenkinsfile code, stored in the Github Repository.

## Jenkins pipeline-syntax

- Jenkins has a built-in **Snippet Generator** utility that is helpful for creating bits of code for individual steps, discovering new steps provided by plugins, or experimenting with different parameters for a particular step.
- The Snippet Generator is dynamically populated with a list of the steps available to the Jenkins instance. The number of steps available is dependent on the plugins installed which explicitly expose steps for use in Pipeline.
- To generate a **step snippet** with the **Snippet Generator**:

- Navigate to the Pipeline Syntax link from a configured Pipeline, or at `${YOUR_JENKINS_URL}/pipeline-syntax`.
- Select the desired step in the Sample Step dropdown menu
- Use the dynamically populated area below the Sample Step dropdown to configure the selected step.
- Click Generate Pipeline Script to create a snippet of Pipeline which can be copied and pasted into a Pipeline.
- The code for a Jenkinsfile should be available in Github Repo
- Click the Add Source button, select git choose the type of repository you want to use and fill in the details.
- Click the Save button and watch your first Pipeline run!

## Jenkins Build with Jenkinsfile

### Configuring Credentials in Jenkinsfile

- Navigate to `Jenkins Home page > Credentials > System > Add Credentials`.
- Select Scope as **Global** - When credentials are to be added for a Pipeline project/item. **System** - When credentials are to be added for a Jenkins itself to interact with system administration functions., such as email authentication, agent connection, etc. This option applies the scope of the credential to a single object only.
- Types of credentials:
  - **Secret text** - a token such as an API token (e.g. a GitHub personal access token)
  - **Username and password** - which could be a colon separated string in the format `username:password`

### Reference

- <https://issues.jenkins.io/browse/JENKINS-66361>

## Jenkins Setup

### Setup JDK for Jenkins

- Install OpenJDK 8 JDK
- To install OpenJDK 8 JDK using yum, run this command:

```
sudo yum install java-1.8.0-openjdk-devel -y
```

- Use below find command to search for files with name "jdk"

```
sudo find / -name "*jdk*"
```

---

Provide the path under provide the path under : Go to **Jenkins Dashboard** -> **Manage Jenkins** -> **Global Tool Configuration** > **JDK** > Give a Name > Give appropriate path to JDK e.g **/usr/lib/jvm/java-1.8.0-openjdk**

## Installing the Git plugin

- We need to install the Git client on to our Jenkins server

```
sudo yum install git -y
git --version
```

- Check if Git Plugin is installed under: **Manage Jenkins** > **Manage Plugins** > **Installed Tab** > **Filter "Git Plugin"** , if not install it from **available** tab.
- This will prompt Jenkins to download the plugin, install it, and restart Jenkins to make it available for use.
